**nReload Pin (Button) function:**

1. After module is powered up, short press this button (0.2< “Low” <1.5s) and loose to make the module go into “SmartLink“ config mode, waiting for APP to set password and other information. (See Appendix to download SmartLink APP)
2. After module is powered up, long press this button (“Low” > 4s) and loose to make the module recover to factory setting.

**UART1 Debug :**

1. Is used for debug log or firmware program. Baud Rate is 921600.

**2.3. RS232 Interface**

Device RS232 does not support hardware flow control. The physical voltage is about  $\pm 7V$ .

**2.4. RS485 Interface**

RS485 use two wire links, A(DATA+), B(DATA-). Connect A(+) to A(+), B(-) to B(-) for communication. Suggest to connect GND together when interference is very severe.

The RS485 interface support maximum 32 485 device, device. The cable maximum length is 1200 meters. Need to add 120Ohm terminal resistor for over 300 meters.

## 3. NETWORK STRUCTURE

### 3.1. Wireless Network

Product can be set as a wireless STA and AP as well. And logically, it supports two wireless interfaces, one is used as STA and the other is AP. Other STA devices can join into the wireless network through AP interface. So the it can provide flexible networking method and network topology.

<Introductions>

AP: Wireless access point which is the central joint. Usually, wireless router is a AP, other STA devices can connect with AP to join the network.

STA: Wireless station which is terminal of a wireless network. Such as laptop and pad etc.

#### 3.1.1. AP Network

HF2211 can construct a wireless network as AP. All the STA devices will consider the AP as the centre of the wireless network. The mutual communication can be transponded by AP, shown as follow:

Figure 22. General AP Network

### 3.1.2. STA Wireless Network

Take the following picture as example. When router works in AP mode, HF2211 connects to the user's devices by RS232/RS485 interface. In this topology, the whole wireless network can be easily stretched.

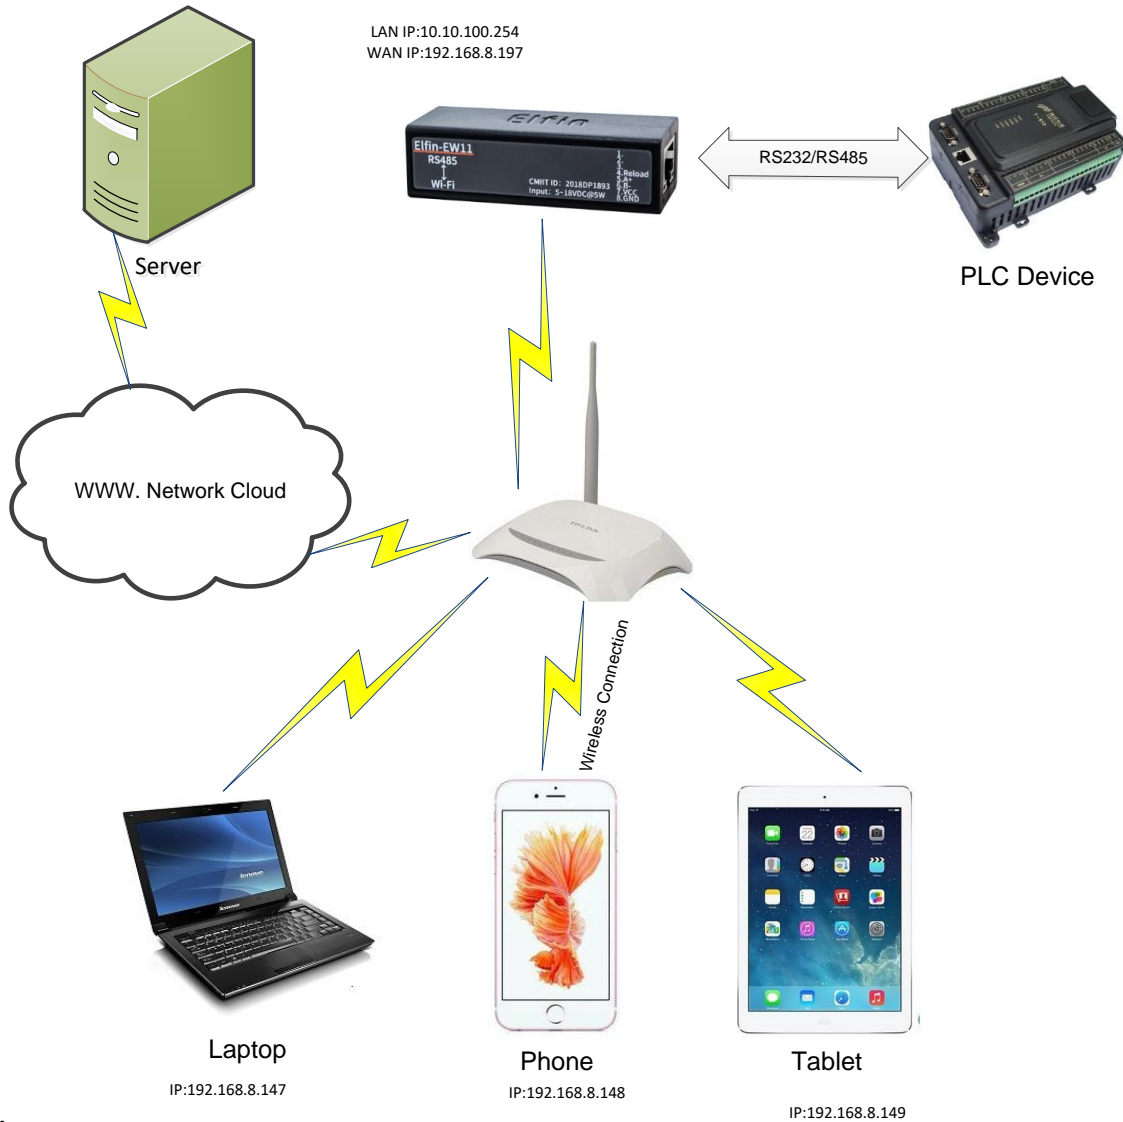

Figure 23. STA Application

### 3.1.3. AP+STA Wireless Network

HF2211 can support AP+STA method. It can support AP and STA interface at the same time. Shown as follow:

Figure 24. AP+STA Wireless Network

In this picture, open the AP+STA function and the STA interface can be connected to the remote server by the router. Similarly, the AP interface can also be used. Phone/PAD can be connected to the AP interface and to control the serial devices or set itself.

Through AP+STA function, it is convenient to use Phone/PAD to monitor the user's devices and not change its original settings.

**Notes that:**

**When the AP+STA function is opened, the STA interface needs to connect to other router. Otherwise, STA interface will endlessly scan the router information nearby. When it is scanning, it will bring bad effects to the AP interface, like losing data etc.**

**AP and STA parts must set to the different sub-network for the product working as APSTA mode.**

**Does not support Wi-Fi repeater function that means device works in AP+STA(STA connects to router), PC connects to device AP, but can not access to internet (If need this router function, use HF2211/HF2221)**

### 3.1.4. IOTService Software

Open the IOTService after connect to the AP hotspot generated by HF2211 or connect to Product Ethernet port to PC, then configure the parameter.
